### Centerville River

**BARNSTABLE** 

The Centerville River estuary and embayment system is located wholly within the Town of Barnstable. It is comprised of a number of subbasins, such as East Bay and Scudder Bay/Bumps River and supports a variety of recreational uses including boating, swimming, shell fishing and fin fishing.

### The Problem

The Massachusetts Estuaries Project (MEP) technical report (available at <a href="www.oceanscience.net/estuaries">www.oceanscience.net/estuaries</a>) indicates the Centerville River system exceeds its critical threshold for nitrogen, resulting in impaired water quality. A Total Maximum Daily Load (TMDL) for nitrogen has been developed and approved.

- **MEP TECHNICAL REPORT STATUS:** Final
- TMDL STATUS: Final TMDL
- TOTAL WASTEWATER FLOW: 427 MGY (million gal per year)
  - Treated Wastewater Flow: 4 MGY
  - Septic Flow: 423 MGY
- UNATTENUATED TOTAL NITROGEN LOAD (MEP):

61,745 Kg/Y (kilograms per year)

- ATTENUATED TOTAL NITROGEN LOAD (MEP): 48.277 Kg/Y
- SOURCES OF CONTROLLABLE NITROGEN (MEP):
  - 87% Septic Systems
  - 6% Lawn Fertilizer
  - 7% Stormwater From Impervious Surfaces

#### CONTRIBUTING TOWN

Percent contributions listed below are the aggregate subembayment contributions identified in Appendix 8C of the Cape Cod Section 208 Plan Update (contributions are based on attenuated load where available). See Appendix 8C for detailed town allocations by sub-embayment.

■ BARNSTABLE: 100%

#### THE MEP RESTORATION SCENARIO:

- WATERSHED TOTAL NITROGEN REDUCTION
  - **TARGET**: 28%
- WATERSHED SEPTIC REDUCTION TARGET: 34% (The scenario represents the aggregated subembayment percent removal targets from the MEP technical report)

#### CENTERVILLE RIVER ESTUARY

- **EMBAYMENT AREA**: 218 acres
- EMBAYMENT VOLUME: 39.8 million cubic feet
- 2014 INTEGRATED LIST STATUS: Category 4a
  - Bumps River: fecal coliform
  - Centerville River: fecal coliform, estuarine bioassessments and nitrogen
  - Category 4a, TMDL is completed
  - www.mass.gov/eea/docs/dep/water/ resources/07v5/14list2.pdf

#### CENTERVILLE RIVER WATERSHED

**ACRES**: 6,739

- **PARCELS**: 7,491
- % DEVELOPED RESIDENTIAL PARCELS: 88%
- PARCEL DENSITY: 0.9 acres per parcel
- **WASTEWATER TREATMENT FACILITIES:** 0
- **GROUND WATER DISCHARGE PERMITS:** 1
  - Cape Regency Health Care facility

### **Freshwater Sources**

#### **PONDS**

- **IDENTIFIED SURFACE WATERS: 39**
- NUMBER OF NAMED FRESHWATER PONDS: 14
- PONDS WITH PRELIMINARY TROPHIC CHARACTERIZATION: 8
- 2014 INTEGRATED LIST STATUS: 6 ponds listed in Category 5 requiring a TMDL.

Three ponds within the adjacent Three Bays watershed (Shubael Pond, Micahs Pond and Joshuas Pond) also contribute to Centerville River. The recent comprehensive wastewater management plan (CWMP) included the preparation of a Pond Action Report.

Yarmouth has participated in the Pond and Lake Stewardship (PALS) program that has helped establish baseline water quality. Trophic characterizations are based on most recent Commission staff assessment.

#### **STREAMS**

■ SIGNIFICANT FRESHWATER STREAM OUTLETS: 4

#### Skunknett River:

- Average Flow: 13,925 cubic meters per day (m3/d)
- Average Nitrate Concentrations: 1.113 milligrams per liter (mg/L)

#### Bumps River:

- Average Flow: 5,679 m3/d
- Average Nitrate Concentrations: 2.207 mg/L

#### Long Pond Stream:

- Average Flow: 6,518 m3/d
- Average Nitrate Concentrations: 0.199 mg/L

#### Lake Elizabeth:

- Average Flow: 1,547 m3/d
- Average Nitrate Concentrations: 0.937 mg/L

Nitrate concentrations higher than 0.05 mg/L background concentrations, evident in public supply wells located in pristine areas, provide evidence of the impact of non-point source pollution on the aquifer and receiving coastal water bodies.

#### DRINKING WATER SOURCES

- WATER DISTRICTS: 2
  - Hyannis Water District
  - Centerville-Osterville-Marstons Mills (COMM)
    Water District
- **GRAVEL PACKED WELLS:** 6
  - 1 has nitrate concentrations between 1 and 2.5 mg/L
  - $\blacksquare$  5 have nitrate concentrations between 2.5 and 5 mg/L
- SMALL VOLUME WELLS: 0

# Degree of Impairment and Areas of Need

For the purposes of the 208 Plan Update, areas of need are primarily defined by the amount of nitrogen reduction required

as defined by the TMDL and/or MEP technical report. For the Centerville River, this amount is 34% of the septic load or 28% of the total load. The MEP technical report also provides a specific targeted amount of nitrogen reduction required by subwatershed (see figures, Subwatersheds with Total Nitrogen Removal Targets and Subwatersheds with Septic Nitrogen Removal Targets).

The nitrogen load from the watershed exceeds the threshold for the Centerville River, resulting in impaired water quality. Lower portions of Centerville River have generally good water quality supported by tidal flushing and significant attenuation to contributing areas, while the upper reach of Centerville River, Centerville River East, has decreased water quality. The ecological health of a water body is determined from water quality, extent of eelgrass, assortment of benthic fauna, and dissolved oxygen and ranges from 1-severe degradation, 2-significantly impaired, 3-moderately impaired, 4- healthy habitat conditions.

# ECOLOGICAL CHARACTERISTICS AND WATER QUALITY

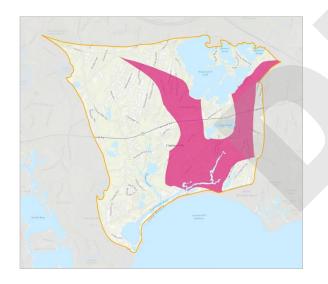

- OVERALL ECOLOGIC CONDITION: Healthy to Significantly Impaired
- **UPPER CENTERVILLE RIVER:** Healthy
- MID CENTERVILLE RIVER: Healthy to Moderately Impaired
- LOWER CENTERVILLE RIVER: Healthy to Significantly Impaired
- EAST BAY: Moderately to Significantly Impaired
- **BUMPS RIVER:** Healthy
- SCUDDER BAY: Moderately Impaired

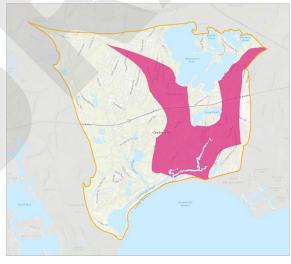

### WATERSHED REPORT: Centerville River

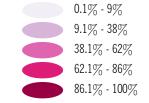

#### ■ SENTINEL STATION:

- Total Nitrogen Concentration Threshold: 0.37 mg/L
- Total Nitrogen Concentration Existing: 0.41 mg/L (As reported at the MEP sentinel water-quality monitoring station.)

Subwatersheds with Total Watershed Removal Targets

(Left) Benthic and atmospheric loads directly on embayments are not included.

Subwatersheds with Septic Nitrogen Removal Targets (Right)

### **Collection & Non-Collection Scenarios**

### **Regional Data**

In 2010, the Commission sought to collect regionally consistent data for the purposes of watershed scenario development. Both parcel data and water use data was identified and collected for the entire region. While the scientific basis for planning is the thresholds identified in the MEP technical reports, each report uses data from different years, and in some cases the MEP data used is 10 or more years old. In addition, there are watersheds on Cape Cod without the benefit of an MEP report; therefore, similar data was not available for planning purposes.

The updated regional data set was used to estimate wastewater, stormwater and fertilizer loads, using the same methodologies as the MEP. This approach allows for a reevaluation of existing development, which may have changed in the last 10 years. Parcel data included in the regional database is from 2010-2012 and water use data is from 2008-2011, depending on the water district. This approach allows for regionally consistent watershed scenario development.

### **Watershed Scenarios**

The watershed scenarios that follow outline possibilities for the watershed. A series of non-traditional technologies that might be applicable are included, as well as the amount of flow and approximate number of residential parcels that would need to be collected if a traditional collection system and treatment facility was implemented. Some assumptions were made in determining the approximate flows and parcels for collection, including a treatment factor of 5 parts per million (ppm), disposal occurring inside the watershed, and no natural attenuation, therefore prioritizing parcels with a direct impact on the water body. Site specific determinations of collection areas may result in the need to collect more or less parcels to meet the nutrient reduction target. The scenarios presented are meant to act as a starting point for discussions regarding effective and cost efficient solutions.

In Centerville River, the Town of Barnstable has done additional and more detailed planning. Included in the last section of this report is a description of their efforts, along with details of plans developed to date.

CENTERVILLE RIVER NITROGEN SOURCES	TOTAL NITROGEN LOAD (kg-N/yr)	
Wastewater	35,986	
Fertilizer	3,166	
Stormwater	4,475	
Other	-3,652	
TOTAL	39,976	
Total Watershed Load (including atmospheric)	39,976	
Total Watershed Threshold	34,833	
TOTAL LOAD TO BE REMOVED	5,143	

## **Collection & Non-Collection Scenarios**

#### Non-Collection

25 % Nitrogen Reduction - Fertilizer Management

25 % Nitrogen Reduction - Stormwater Mitigation

6 Acres - Constructed Wetlands (Collection System)

5,600 Linear Feet - Permeable Reactive Barrier (PRB)

150 Acres - Fertigation - Turf

9 Acres - Aquaculture/Oyster Beds

1,285 People Per Year - UD School or Public Facility

#### Collection

RESIDENTIAL EQUIVALENTS NECESSARY TO MEET NITROGEN REDUCTION TARGET VIA COLLECTION

= 50 Residential Parcels

1,217

175,186

Residential Equivalents Necessary to Meet Nitrogen Reduction Target

Flow Collected (gpd)

SCENARIO ASSUMPTIONS: Assumes treatment to 5 parts per million (ppm) nitrogen. Assumes disposal occurs inside the watershed. Assumes no natural attenuation; therefore, prioritizing parcels with a direct impact on the water body.

## **Town of Barnstable Local Progress**

The Cape Cod Commission and the Town of Barnstable met and discussed the use of WatershedMVP to evaluate targeted watershed approaches for each of the watersheds in which they have jurisdiction. In 2015, the town reformulated its Citizen's Advisory Committee (CAC) for wastewater planning to better address local needs. In addition to local participation, the newly formed committee (the Water Resources Advisory Committee or WRAC) includes state and regional representatives. Town staff provided modifications to Commission-developed watershed scenarios and presented those scenarios to their WRAC for review and discussion. Those scenarios are included in this report.

Barnstable is also working closely with Mashpee and Sandwich on a watershed permit for the Popponesset Bay watershed.

The Town of Barnstable operates the Hyannis Water Pollution Control Facility (WPCF), located off Bearses Way in Hyannis, which is the primary wastewater treatment facility serving approximately 2,900 properties in Hyannis and Barnstable village. The treatment facility has been upgraded and permitted to treat additional flows up to a total of 4.2 million gallons per day (MGD), upon meeting requirements of an adaptive management plan approved by the Commission in 2007. Property along Route 132 was acquired by the town in 2002 to potentially accommodate future disposal needs. The site is approved under a 2006 Massachusetts Environmental Policy Act (MEPA) certificate to discharge up to 0.5 MGD. The site is not presently in use. However, a force main and sewer has been extended to the site from the WPCF.

The WPCF treats an average daily flow of 1.46 MGD and a maximum monthly average flow of 1.94 MGD. Treatment performance has averaged 5 milligrams per liter (mg/L) total nitrogen in the treated effluent and the facility has a discharge limit of 5 mg/L under the 2007 Development of Regional Impact (DRI) decision and a limit of 10 mg/L under a Groundwater Discharge Permit (GWDP). The facility is also equipped with sludge thickening, storage and dewatering facilities sized for the current process conditions.

The Town of Barnstable also operates two smaller facilities — the Marstons Mills Wastewater Treatment Facility (WWTF) and the Red Lily Pond Cluster System. The Marstons Mills WWTF is limited to a discharge flow of 42,900 gallons per day (GPD) and is intended to service the Barnstable United Elementary School and the Village at Marstons Mills affordable housing development. The Red Lily Pond Cluster System currently serves 17 homes. According to the comprehensive wastewater management plan (CWMP) approved in 2007, no performance sampling of the system occurs and the system is assumed to produce comparable effluent to any conventional single family septic system.

In addition to municipally-owned facilities, there are two privately-owned treatment facilities treating wastewater from the Cotuit Landing shopping plaza and the Cape Regency nursing and rehabilitation facility. These facilities provide high levels of wastewater treatment. The treatment facility at Cotuit Landing was designed with additional treatment capacity beyond the expected needs of the shopping plaza for potential treatment of flows from neighboring properties.

Barnstable is working on a town-wide nutrient management plan that will provide the basis of its CWMP. The plan will address nitrogen and other needs in watersheds draining to Three Bays, Centerville River, and Lewis Bay. A nitrogen total maximum daily load (TMDL) for Barnstable Harbor has not been approved by US EPA. The MEPA certificate scope for the Final Environmental Impact Report (FEIR) includes engagement in a targeted watershed approach, consistent with the 208 Plan Update.

In the fall of 2014, Barnstable adopted local nitrogen-oriented fertilizer management regulations consistent with the Capewide Fertilizer Managem ent District of Critical Planning Concern (DCPC).

In 2015, the Town submitted a Statement of Interest to the US EPA for a hydrogeologic site characterization as an initial step toward piloting a permeable reactive barrier in the town. One of three sites proposed by the Town was selected for characterization. The work was completed in 2016. The draft report is presently being reviewed by the Town.

In June 2016, Barnstable received \$28,850 from the Commission to fund upgrades to three stormwater treatment BMPs. Funding was part of \$142,149 in local grants made available to communities by the Commission in support of 208 Plan implementation.

# **Town of Barnstable Watershed Scenario Details**

Centerville River	CREDITS		REDUCTION TECHNOLOGIES		REMEDIATION AND RESTORATION TECHNOLOGIES		REMOVAL	
NAME OF TECHNOLOGY	% Nitrogen Reduction	Load Reduction (kg-N/yr)	# Properties / Units	Flow Collected (gpd)	Load Reduction (kg-N/yr)	# Units Proposed Unit Metric	Load Reduction (kg-N/yr)	Total Scenario Load Reduction (kg-N/yr)
Traditional Scenario								15,2
